

1 Integrals

Compute the following integrals:

$$\begin{aligned} & \int 5x^3 - 10x^{-6} + 4dx \\ & \int \pi^8 + \pi^{-8} dx \\ & \int 3\sqrt[4]{x^3} + \frac{7}{x^5} + \frac{1}{6\sqrt{x}} dx \\ & \int \frac{15}{x} dx \\ & \int \exp(x) dx \\ & \int_1^2 y^2 + y^{-2} dy \\ & \int_{-3}^1 6y^2 - 5y + 2 dy \\ & \int_0^u \lambda \exp(\lambda y) dy \\ & \int_{-\infty}^a \frac{1}{2b} \exp\left(-\frac{|y - \mu|}{b}\right) dy, \quad \text{for } \mu \in \mathbb{R} \quad \text{and} \quad b \in \mathbb{R}^+. \end{aligned}$$

2 Combinatorics

Combinatorics is a branch of mathematics concerning the study of finite or countable discrete structures. We will enumerate the number of ways of selecting k items from a collection of n objects. In this class we will use several kinds of combinations:

1. Permutation with repetition: n^k
we draw (with replacement) k elements from n objects.

2. Permutation without repetition: $P_n^n = n!$
we draw (without replacement) n elements from n objects.
3. Partial permutations: $P_k^n = \frac{n!}{(n-k)!}$
we draw (without replacement) k elements from n objects.
4. Combinations: $C_k^n = \frac{n!}{k!(n-k)!}$
Same as a partial permutation but the order of the items doesn't count. The formula comes from:

Partial permutations = Permutations of the outcome \times Combinations

$$\text{That is : } P_k^n = P_k^k \times \binom{n}{k}$$

Theorem:

$$\binom{n}{r} = \binom{n-1}{r-1} + \binom{n-1}{r} \quad \text{for } 1 \leq r \leq n \quad (1)$$

1) Assume there are 6 women and 4 men taking an exam. Then they are ranked according to their grades.

- How many possible rankings can we get?
- If the women are ranked between them, and the men between them. How many possible global rankings do we have?

2) How many car number plates with 7 items does it exist:

- if the first two are letters and the five last are digits?
- same question but we assume that there is no repetition of the letters and the digits.

3) Suppose that a fair coin is tossed five times. The outcome of the experiment is registered with H if the result of the tossing is head and with T if the outcome is tail (the outcomes would look like $HHTHT, THTTH$ and so on).

- How many possible outcomes do we have?
- How many of these five dimensional outcomes would include two heads?

4) A committee of 3 is to be formed from a group of 20 people. How many different committees are possible?

3 Taylor Expansions

Binomial Theorem:

$$(a + b)^n = \sum_{k=0}^n \binom{n}{k} a^k b^{n-k} \quad (2)$$

A Taylor series of a function $f(x)$ about x_0 is the power series

$$\begin{aligned} f(x) &= f(x_0) + f'(x_0)(x - x_0) + \frac{f''(x_0)}{2!}(x - x_0)^2 + \dots + \frac{f^{(n)}(x_0)}{n!}(x - x_0)^n + \dots \quad (3) \\ &= \sum_{k=0}^{\infty} \frac{f^{(k)}(x_0)}{k!}(x - x_0)^k \quad (4) \end{aligned}$$

A Maclaurin series is a Taylor expansion of a function about $x_0 = 0$.

1) Using binomial theorem, compute the following expansions:

$$\begin{aligned} (x + y)^2 \\ (x - y)^2 \\ x^2 - y^2 \\ (x + y)^3 \\ x^3 + y^3 \end{aligned}$$

2) Find the Maclaurin expansions of the following functions $f(x) = \frac{1}{1-x}$ and $g(x) = \exp(x)$.

4 Sums

1) Compute the sum of the first 100 integers, namely find the value of

$$\sum_{i=1}^{100} i = 1 + 2 + 3 + \dots + 100.$$

2) Find a general formula for: $\sum_{i=1}^n i$.
