Probability 1

Chapter 05 : Continuous Random Variables - Part 2

Dr. Daniel Flores-Agreda,

(based on the notes of Prof. Davide La Vecchia)

Spring Semester 2021

Objectives

- End exploration of the main properties of the Normal Distribution
- Explore other important Continuous Distributions

Outline

- Gaussian Distribution (continued)
- The Chi-squared distribution
- 3 The Student-t distribution
- The F distribution
- The lognormal distribution
- **6** Exponential distribution

Outline

- Gaussian Distribution (continued)
- 2 The Chi-squared distribution
- The Student-t distribution
- The F distribution
- The lognormal distribution
- Exponential distribution

We explored the Normal PDF

$$\phi_{(\mu,\sigma)}(x) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left\{-\frac{1}{2\sigma^2} (x-\mu)^2\right\} - \infty < x < \infty$$

And the Normal CDF

$$\Phi_{(\mu,\sigma)}(x) = \int_{-\infty}^{x} \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left\{-\frac{1}{2\sigma^2} \left(t - \mu\right)^2\right\} dt$$

We saw that to evaluate the CDF, we could make use of the **Standard Normal** CDF using integration by substitution $s = \frac{t-\mu}{\sigma}$

$$P(X \le x) = \Phi_{(\mu,\sigma)}(x) = \int_{-\infty}^{x} \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left\{-\frac{1}{2\sigma^2} (t - \mu)^2\right\} dt$$
$$= \int_{-\infty}^{\frac{x-\mu}{\sigma}} \frac{1}{\sqrt{2\pi}} \exp\left\{-\frac{1}{2}s^2\right\} ds$$
$$\Phi_{(\mu,\sigma)}(x) = \Phi\left(\frac{x-\mu}{\sigma}\right)$$

Last class we said that, the Normal PDF is Symmetric

$$\phi_{(\mu,\sigma)}(-x) = \phi_{(\mu,\sigma)}(x)$$

Density of N(0,2.25)

0.2

0.1

0.0

-x

x

0.0

2.5

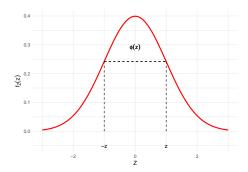

5.0

-2.5

-5.0

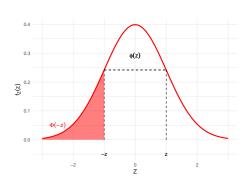

Of course, the Standard Normal PDF is also Symmetric

$$\phi(-x) = \phi(x)$$

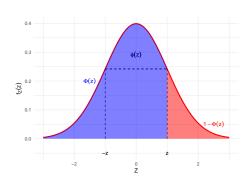

Symmetry of the PDF implies that the CDF can be computed as

$$\Phi(-x) = 1 - \Phi(x)$$

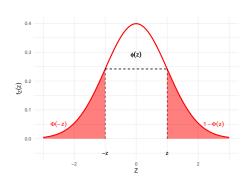

Symmetry of the PDF implies that the CDF can be computed as

$$\Phi(-x) = 1 - \Phi(x)$$

Symmetry of the PDF implies that the CDF can be computed as

$$\Phi(-x) = 1 - \Phi(x)$$

We can **shift and scale** any Normal Random Variable X and reach a **Standard Normal Random Variable** Z

$$X \sim \mathcal{N}\left(\mu, \sigma^2\right) \Longleftrightarrow Z = \frac{X - \mu}{\sigma} \sim \mathcal{N}\left(0, 1\right)$$

We can **shift and scale** any Normal Random Variable X and reach a **Standard Normal Random Variable** Z

$$X \sim \mathcal{N}\left(\mu, \sigma^2\right) \Longleftrightarrow Z = \frac{X - \mu}{\sigma} \sim \mathcal{N}\left(0, 1\right)$$

We can always transform from X to Z

$$Z = \frac{X - \mu}{\sigma}$$
 (for the random variable) and $z = \frac{x - \mu}{\sigma}$ (for its values),

and return back to X by a 're-scaling' and 're-shifting':

$$X = \sigma Z + \mu$$
 (for the random variable) and $x = \sigma z + \mu$ (for its values).

We can **shift and scale** any Normal Random Variable X and reach a **Standard Normal Random Variable** Z

$$X \sim \mathcal{N}\left(\mu, \sigma^2\right) \Longleftrightarrow Z = \frac{X - \mu}{\sigma} \sim \mathcal{N}\left(0, 1\right)$$

• We can always **transform from** X **to** Z

$$Z = \frac{X - \mu}{\sigma}$$
 (for the random variable) and $z = \frac{x - \mu}{\sigma}$ (for its values),

• and return back to X by a 're-scaling' and 're-shifting':

$$X = \sigma Z + \mu$$
 (for the random variable) and $x = \sigma z + \mu$ (for its values).

Remark (Implication)

Statements about a Normal Random Variable can always be translated into equivalent statements about a standard Normal Random Variable, (and vice-versa).

In particular, the CDF of any Normal Random Variable $X \sim \mathcal{N}(\mu, \sigma^2)$, can be computed with a Standard CDF

$$P(\lbrace X \leq x \rbrace) = P\left(\left\{\frac{X - \mu}{\underbrace{\sigma}_{Z}} \leq \underbrace{x - \mu}_{z}\right\}\right)$$
$$= P(\lbrace Z \leq z \rbrace)$$
$$P(\lbrace X \leq x \rbrace) = \Phi(z)$$

Moreover, we can also compute the probabilities of any interval for $X \sim \mathcal{N}\left(\mu, \sigma^2\right)$ with the **Standard CDF**

$$P(\{x_1 < X \le x_2\}) = P\left(\left\{\frac{x_1 - \mu}{\sigma} < \frac{X - \mu}{\sigma} \le \frac{x_2 - \mu}{\sigma}\right\}\right)$$

$$= P(\{z_1 < Z \le z_2\})$$

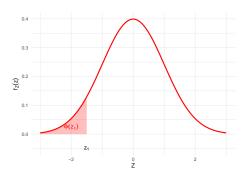

$$= P(\{Z \le z_2\}) - P(\{Z \le z_1\})$$

$$P(\{x_1 < X \le x_2\}) = \Phi(z_2) - \Phi(z_1)$$

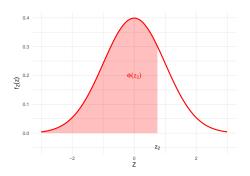

where $z_1 = (x_1 - \mu)/\sigma$ and $z_2 = (x_2 - \mu)/\sigma$.

$$P(\{z_1 < Z \leq z_2\}) = P(\{Z \leq z_2\}) - P(\{Z \leq z_1\}) = \Phi(z_2) - \Phi(z_1)$$

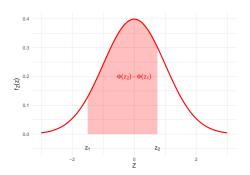

$$P(\{z_1 < Z \le z_2\}) = P(\{Z \le z_2\}) - P(\{Z \le z_1\}) = \Phi(z_2) - \Phi(z_1)$$

$$P(\{z_1 < Z \le z_2\}) = P(\{Z \le z_2\}) - P(\{Z \le z_1\}) = \Phi(z_2) - \Phi(z_1)$$

$$P(\{z_1 < Z \le z_2\}) = P(\{Z \le z_2\}) - P(\{Z \le z_1\}) = \Phi(z_2) - \Phi(z_1)$$

Remark

The integral that defines the CDF of the standard normal:

$$P({Z \le z}) = \Phi(z) = \int_{-\infty}^{z} \phi(s) ds$$

does not have a closed-form expression.

• It has to be **approximated using a computer**, e.g. with R.

$$pnorm(1.924, mean = 0, sd = 1)$$

• We can read $\Phi(z)$ for $z \ge 0$ from **Standard Normal Tables**

Remark

The integral that defines the CDF of the standard normal:

$$P({Z \le z}) = \Phi(z) = \int_{-\infty}^{z} \phi(s) ds$$

does not have a closed-form expression.

• It has to be **approximated using a computer**, e.g. with R.

$$pnorm(1.924, mean = 0, sd = 1)$$

• We can read $\Phi(z)$ for $z \ge 0$ from **Standard Normal Tables**

Remark

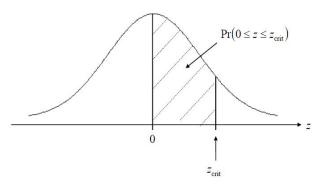

We can obtain $\Phi(z)$ for z < 0 by symmetry of $\phi(z)$ which, again, entails:

$$\Phi(-z) = 1 - \Phi(z)$$

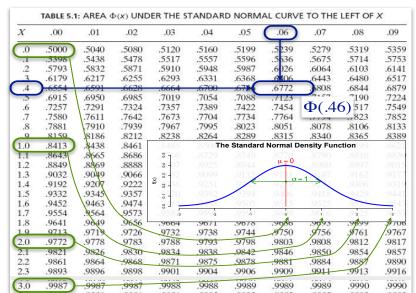

Description of the values contained in the table:

STATISTICAL TABLES

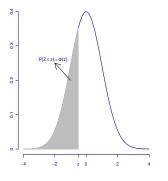

TABLE 1: AREAS UNDER THE STANDARDIZED NORMAL DISTRIBUTION

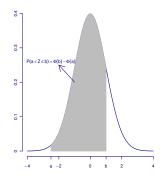

Contents of the table

One can use these tables to compute integrals/probabilities of the type:

Example (Prob of Z)

$$P(\{Z \le 1\}) \approx 0.8413$$

 $P(\{Z \le 1.96\}) \approx 0.9750$
 $P(\{Z \ge 1.96\}) = 1 - P(\{Z \le 1.96\}) \approx 1 - 0.9750 = 0.0250$
 $P(\{Z \ge -1\}) = P(\{Z \le 1\}) \approx 0.8413$
 $P(\{Z \le -1.5\}) = P(\{Z \ge 1.5\}) = 1 - P(\{Z \le 1.5\}) \approx 1 - 0.9332 = 0.0668$

Example (continued)

$$P(\{0.64 \le Z \le 1.96\}) = P(\{Z \le 1.96\}) - P(\{Z \le 0.64\})$$

$$\approx 0.9750 - 0.7389 = 0.2361$$

$$P(\{-0.64 \le Z \le 1.96\}) = P(\{Z \le 1.96\}) - P(\{Z \le -0.64\})$$

$$= P(\{Z \le 1.96\}) - [1 - P(\{Z \le 0.64\})]$$

$$\approx 0.9750 - (1 - 0.7389) = 0.7139$$

$$P(\{-1.96 \le Z \le -0.64\}) = P(\{0.64 \le Z \le 1.96\})$$

$$\approx 0.2361$$

Example

On the highway A2 (in the Luzern area), the speed is limited to 80 km/h. A radar measures the speeds of all the cars. Assuming that the registered speeds are distributed according to a Normal law with mean 72 km/h and standard error 8 km/h:

What is the proportion of the drivers who will have to pay a penalty for high speed?

21 / 48

Example

On the highway A2 (in the Luzern area), the speed is limited to 80 km/h. A radar measures the speeds of all the cars. Assuming that the registered speeds are distributed according to a Normal law with mean 72 km/h and standard error 8 km/h:

What is the probability that a driver who will roll at a speed > 80

Example

On the highway A2 (in the Luzern area), the speed is limited to 80 km/h. A radar measures the speeds of all the cars. Assuming that the registered speeds are distributed according to a Normal law with mean 72 km/h and standard error 8 km/h:

What is the probability that a driver who will roll at a speed > 80

Let X be the random variable expressing the registered speed: $X \sim \mathcal{N}(72,64)$.

Since a driver has to pay if its speed is above 80 km/h, the proportion of drivers paying a penalty is expressed through P(X > 80):

$$P(X > 80) = P\left(Z > \frac{80 - 72}{8}\right) = 1 - \Phi(1) = 1 - 0.8413 = 0.1587$$

where $Z \sim \mathcal{N}(0,1)$.

Hence, the proportion will be around 16%

In particular, lets consider the probabilty of intervals of the form:

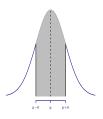

$$P(\{\mu - \mathbf{k}\sigma \le X \le \mu + \mathbf{k}\sigma\})$$

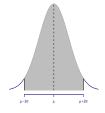

for a factor $k \in$

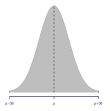

$$k = 1$$

$$k = 2$$

$$k = 3$$

It can be seen that the shaded areas under the pdfs are (approximately) equivalent to 0.683, 0.954 and 0.997, respectively.

Definition (Rule '68 – 95 – 99.7')

If X is a Normal random variable, $X \sim \mathcal{N}(\mu, \sigma^2)$, its realization has approximately a probability of

- 68 % of being in the interval $[\mu \sigma, \mu + \sigma]$;
- 95 % of being in the interval $[\mu 2\sigma, \mu + 2\sigma]$;
- 99.7% of being in the interval $[\mu 3\sigma, \mu + 3\sigma]$.

Expectation and Variance

For
$$X \sim \mathcal{N}\left(\mu, \sigma^2\right)$$

$$E\left[X\right] = \mu \text{ and } Var\left(X\right) = \sigma^2.$$

Expectation and Variance

For
$$X \sim \mathcal{N}\left(\mu, \sigma^2\right)$$

$$E\left[X\right] = \mu \text{ and } Var\left(X\right) = \sigma^2.$$

Linear Transformations

If a is a number, then

$$X + a \sim \mathcal{N}(\mu + a, \sigma^2)$$

 $aX \sim \mathcal{N}(a\mu, a^2\sigma^2).$

Expectation and Variance

For
$$X \sim \mathcal{N}\left(\mu, \sigma^2\right)$$

$$E\left[X\right] = \mu \text{ and } Var\left(X\right) = \sigma^2.$$

Linear Transformations

If a is a number, then

$$X + a \sim \mathcal{N}(\mu + a, \sigma^2)$$

 $aX \sim \mathcal{N}(a\mu, a^2\sigma^2).$

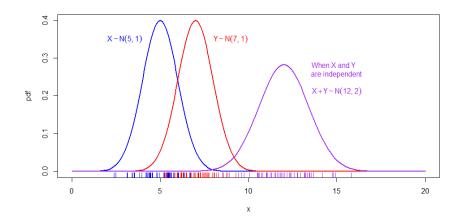

Sum of two Independent Normal RV's

If $X \sim \mathcal{N}\left(\mu, \sigma^2\right)$ and $Y \sim \mathcal{N}\left(\alpha, \delta^2\right)$, and X and Y are **independent** then

$$X + Y \sim \mathcal{N} \left(\mu + \alpha, \sigma^2 + \delta^2 \right)$$
.

24 / 48

Gaussian Distribution (continued)

Locations of n = 30 sampled values of X, Y, and X + Y shown as tick marks under each respective density.

Gaussian Distribution (continued)

Example

On the highway A2 (in the Luzern area), the speed is limited to 80 km/h. A radar measures the speeds of all the cars. Assuming that the registered speeds are distributed according to a Normal law with mean 72 km/h and standard error 8 km/h:

Knowing that in addition to the penalty, a speed higher than $30 \, km/h$ (over the max allowed speed) implies a withdrawal of the driving license, what is the proportion of the drivers who will lose their driving license among those who will have a to pay a fine?

Gaussian Distribution (continued)

Example

On the highway A2 (in the Luzern area), the speed is limited to 80 km/h. A radar measures the speeds of all the cars. Assuming that the registered speeds are distributed according to a Normal law with mean 72 km/h and standard error 8 km/h:

We are looking for the conditional probability of a recorded speed greater than 110 $\underline{\text{given that}}$ the driver has had already to pay a fine:

$$\begin{split} P(X > 110 | X > 80) &= \frac{P(\{X > 110\} \bigcap \{X > 80\})}{P(X > 80)} \\ &= \frac{P(X > 110)}{P(X > 80)} = \frac{1 - \Phi((110 - 72)/8)}{1 - \Phi(1)} \approx \frac{0}{16\%} \simeq 0. \end{split}$$

26 / 48

Outline

- Gaussian Distribution (continued)
- The Chi-squared distribution
- The Student-t distribution
- The F distribution
- The lognormal distribution
- 6 Exponential distribution

Definition

If Z_1, Z_2, \ldots, Z_n are independent standard Normal random variables, then

$$X = Z_1^2 + Z_2^2 + \dots + Z_n^2$$

has a chi-squared distribution with n degrees of freedom. Write as $X \sim \chi^2(n)$.

28 / 48

Definition

If Z_1, Z_2, \ldots, Z_n are independent standard Normal random variables, then

$$X = Z_1^2 + Z_2^2 + \dots + Z_n^2$$

has a chi-squared distribution with n degrees of freedom. Write as $X \sim \chi^2(n)$.

Remark

 $X \sim \chi^2(n)$ can take only positive values. Moreover, expected value and variance, for $X \sim \chi^2(n)$, are:

$$E[X] = n$$

 $Var(X) = 2n$

Remark

If $X \sim \chi^2(n)$ and $Y \sim \chi^2(m)$ are independent then $X + Y \sim \chi^2(n+m)$.

Quantiles for Chi-squared probabilities may be read from a table.

TABLE 3: CHI-SQUARED DISTRIBUTION: CRITICAL VALUES

For a particular number of degrees of freedom $\, \nu$, each entry represents the

value of χ^2_{ν} corresponding to a specified upper tail area a.

Upper Tail Areas, a

Example

Let X be a chi-squared random variable with 10 degrees-of-freedom. What is the value of its upper fifth percentile?

By definition, the upper fifth percentile is the chi-squared value x (lower case!!!) such that the probability to the right of x is 0.05 (so the upper tail area is 5%). To find such an x we use the chi-squared table:

- ullet setting ${\cal V}=10$ in the first column on the left and getting the corresponding row
- finding the column headed by $P(X \ge x) = 0.05$.

Now, all we need to do is read the corresponding cell. What do we get? Well, the table tells us that the upper fifth percentile of a chi-squared random variable with 10 degrees of freedom is 18.30703.

31 / 48

Outline

- Gaussian Distribution (continued)
- 2 The Chi-squared distribution
- 3 The Student-t distribution
- The F distribution
- The lognormal distribution
- Exponential distribution

The Student-t distribution

Definition

If $Z \sim \mathcal{N}(0,1)$ and $Y \sim \chi^2(v)$ are **independent** then

$$T = \frac{Z}{\sqrt{Y/v}}$$

has a **Student-t** distribution with v degrees of freedom. Write as $T \sim t_v$.

 $T \sim t_{
m v}$ can take any value in \mathbb{R} . Expected value and variance for $T \sim t_{
m v}$ are

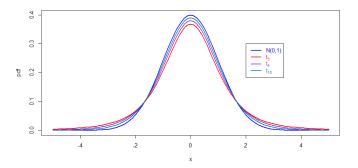

$$E[T] = 0$$
, for $v > 1$
 $Var(T) = \frac{v}{v-2}$, for $v > 2$.

33 / 48

The Student-t distribution

Remark

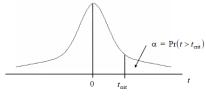

The pdf of $T \sim t_v$ is similar to a Normal (with mean zero) but with fatter tails. When v is large (typically, $v \geq 120$) t_v approaches $\mathcal{N}(0,1)$.

The Student-t distribution

TABLE 2: STUDENT t DISTRIBUTION: CRITICAL VALUES

For a particular number of degrees of freedom ν , each entry represents the value of t corresponding to a specified upper tail area a.

The F distribution

Definition

If $X \sim \chi^2(v_1)$ and $Y \sim \chi^2(v_2)$ are **independent**, then

$$F = \frac{\frac{X}{v_1}}{\frac{Y}{v_2}},$$

has an **F** distribution with v_1 'numerator' and v_2 'denominator' degrees of freedom. Write as $F \sim F_{v_1,v_2}$.

 $F \sim F_{\nu_1,\nu_2}$ can take only **positive** values. Expected value and variance for $F \sim F_{\nu_1,\nu_2}$ (note that the order of the degrees of freedom is important!).

$$E[F] = \frac{v_2}{v_2 - 2}, \text{ for } v_2 > 2$$

$$Var(F) = \frac{2v_2^2(v_1 + v_2 - 2)}{v_1(v_2 - 2)^2(v_2 - 4)}, \text{ for } v_2 > 4.$$

The F distribution

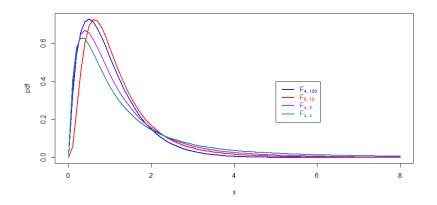

TABLE 4: F_{v_1,v_2} DISTRIBUTION: $\alpha = 0.05$ CRITICAL VALUES

For a particular pair of degrees of freedom, V_1 : numerator

and $\nu_{_2}$: denominator, each entry represents the value of F_{ν_i,ν_i} corresponding to the upper tail area $\,\alpha$.

- The lognormal distribution
- 6 Exponential distribution

The lognormal distribution

Definition

Y has a lognormal distribution when

$$ln(Y) = X$$

has a Normal distribution. We write $Y \sim lognormal(\mu, \sigma^2)$.

If $Y \sim \textit{lognormal}(\mu, \sigma^2)$ then

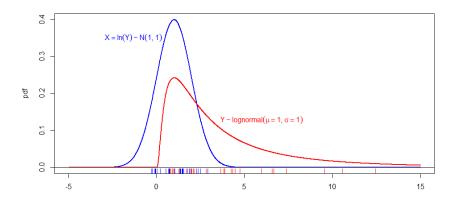

$$E[Y] = \exp\left(\mu + \frac{1}{2}\sigma^2\right)$$

 $Var(Y) = \exp\left(2\mu + \sigma^2\right)\left(\exp\left(\sigma^2\right) - 1\right).$

41 / 48

The lognormal distribution

Let us just see some plots... more to come later...

Outline

- Gaussian Distribution (continued)
- 2 The Chi-squared distribution
- The Student-t distribution
- The F distribution
- The lognormal distribution
- 6 Exponential distribution

Definition

Let X be a continuous random variable, having the following characteristics:

- X is defined on the positive real numbers $(0; \infty)$ namely \mathbb{R}^+ ;
- the pdf and CDF are

$$f_X(x) = \lambda \exp\{-\lambda x\}, \lambda > 0; \quad F_X(x) = 1 - \exp(-\lambda x);$$

then we say that X has an exponential distribution. We write $X \sim \text{Exp}(\lambda)$.

Definition

Let X be a continuous random variable, having the following characteristics:

- X is defined on the positive real numbers $(0; \infty)$ namely \mathbb{R}^+ ;
- the pdf and CDF are

$$f_X(x) = \lambda \exp\{-\lambda x\}, \lambda > 0; \quad F_X(x) = 1 - \exp(-\lambda x);$$

then we say that X has an exponential distribution. We write $X \sim \text{Exp}(\lambda)$.

For $X \sim \mathsf{Exp}(\lambda)$ we have that:

$$E[X] = \int_0^\infty x f_X(x) dx = 1/\lambda \quad \text{and} \quad Var(X) = \int_0^\infty x^2 f_X(x) dx - E^2(X) = 1/\lambda^2.$$

Definition

Let X be a continuous random variable, having the following characteristics:

- X is defined on the positive real numbers $(0; \infty)$ namely \mathbb{R}^+ ;
- the pdf and CDF are

$$f_X(x) = \lambda \exp\{-\lambda x\}, \lambda > 0; \quad F_X(x) = 1 - \exp(-\lambda x);$$

then we say that X has an exponential distribution. We write $X \sim \text{Exp}(\lambda)$.

For $X \sim \mathsf{Exp}(\lambda)$ we have that:

$$E[X] = \int_0^\infty x f_X(x) dx = 1/\lambda \quad \text{and} \quad Var(X) = \int_0^\infty x^2 f_X(x) dx - E^2(X) = 1/\lambda^2.$$

Remark

X is typically applied to model the waiting time until an event occurs, when events are always occurring at a random rate $\lambda>0$. Moreover, the sum of independent exponential random variables has a Gamma distribution (see tutorial).

Example

Let $X \sim \text{Exp}(\lambda)$, with $\lambda = 0.5$. Thus

$$f_X(x) = \begin{cases} 0.5 \exp(-0.5x) & x > 0 \\ 0 & \text{otherwise} \end{cases}$$

Then, find the CDF.

Example

Let $X \sim \text{Exp}(\lambda)$, with $\lambda = 0.5$. Thus

$$f_X(x) = \begin{cases} 0.5 \exp(-0.5x) & x > 0 \\ 0 & \text{otherwise} \end{cases}$$

Then, find the CDF.

For x > 0, we have

$$F_X(x) = \int_0^x f_X(u) du$$

$$= 0.5 \left(-2 \exp(-0.5u) \right) \Big|_{u=0}^{u=x}$$

$$= 0.5 (-2 \exp(-0.5x) + 2 \exp(0))$$

$$= 1 - \exp(-0.5x)$$

Example

Let $X \sim \text{Exp}(\lambda)$, with $\lambda = 0.5$. Thus

$$f_X(x) = \begin{cases} 0.5 \exp(-0.5x) & x > 0 \\ 0 & \text{otherwise} \end{cases}$$

Then, find the CDF.

For x > 0, we have

$$F_X(x) = \int_0^x f_X(u) du$$

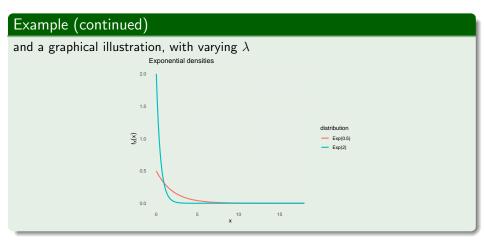

$$= 0.5 \left(-2 \exp(-0.5u) \right) \Big|_{u=0}^{u=x}$$

$$= 0.5 (-2 \exp(-0.5x) + 2 \exp(0))$$

$$= 1 - \exp(-0.5x)$$

so, finally,

$$F_X(x) = \begin{cases} 0 & x \le 0 \\ 1 - \exp(-0.5x) & x > 0 \end{cases}$$

Wrap-up

- Properties of any Normal-distributed Random Variable can be figured out by studying the Standard Normal.
- The Standard Normal is at the core of many other important distribution (Chi-Square, Student's, Fisher's F, log-normal)
- The Cumulative Probabilities of a standard normal Z for z>0 are in tables, and can help us calculate the probability of any interval for any Normal.
- The other distributions introduce the notion of degrees of freedom and their tables display the quantiles for some upper or lower-tail probabilities for distribution with given degrees of freedom.
